

Route calculation from link state

Input LINK_STATE

local=1 peer=2 ingress=0 metric=1

Validate

identity + freshness

Versioned updates

monotonic route_version

Forward route

owner=1 dst=2 next_hop=2 port=link

Reverse route

owner=2 dst=1 next_hop=1 port=link

Node apply rule

ignore older route_version; delete explicitly

Current metric is hop-based; the data model can carry weighted costs later.
